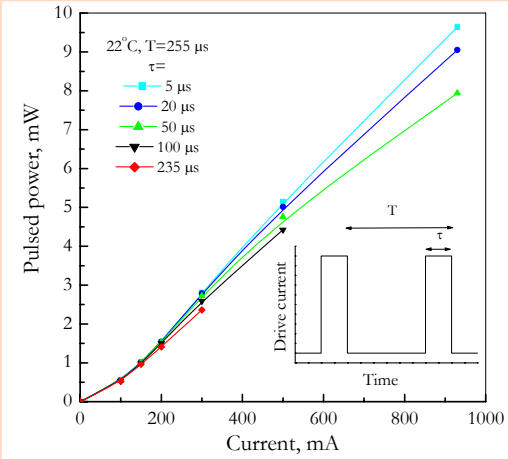
Features

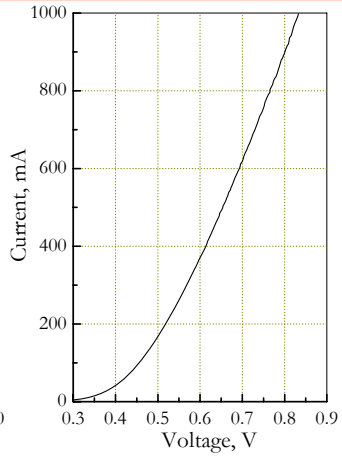
Growth of narrow gap semiconductor alloys onto n^+-GaSb substrate; Flip-chip design of LEDs; Optical coupling through the use of chalcogenide glasses and Si lenses with antireflection coating

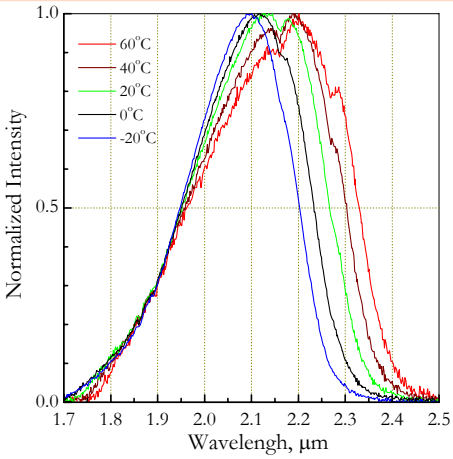
3-fold increased LED output power; Beam collimation within ~15 deg; Low serial resistance; Small on-off time (tenths of ns); Low power consumption (≤0.1 W)

Emission beam divergence is small and thus we recommend adjusting LED position regarding to the detector system before final evaluation/use of the devices. We recommend if possible using low duty cycle mode of operation with I<0.5×Imax so that higher efficiency and long term stability of a LED are achieved. **Data are valid for 22ºC and LED attached to a heatsink**. Heatsink is important for LED operation especially in the CW mode.

L-I and I-V characteristics and emission spectra







Output power and peak wavelength vs temperature, far-field pattern and maximal current vs operation conditions
